This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing,

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

#### Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Ce logiciel et la documentation qui l'accompagne sont protégés par les lois sur la propriété intellectuelle. Ils sont concédés sous licence et soumis à des restrictions d'utilisation et de divulgation. Sauf stipulation expresse de votre contrat de licence ou de la loi, vous ne pouvez pas copier, reproduire, traduire, diffuser, modifier, accorder de licence, transmettre, distribuer, exposer, exécuter, publier ou afficher le logiciel, même partiellement, sous quelque forme et par quelque procédé que ce soit. Par ailleurs, il est interdit de procéder à toute ingénierie inverse du logiciel, de le désassembler ou de le décompiler, excepté à des fins d'interopérabilité avec des logiciels tiers ou tel que prescrit par la loi.

Les informations fournies dans ce document sont susceptibles de modification sans préavis. Par ailleurs, Oracle Corporation ne garantit pas qu'elles soient exemptes d'erreurs et vous invite, le cas échéant, à lui en faire part par écrit.

Si ce logiciel, ou la documentation qui l'accompagne, est livré sous licence au Gouvernement des Etats-Unis, ou à quiconque qui aurait souscrit la licence de ce logiciel pour le compte du Gouvernement des Etats-Unis, la notice suivante s'applique :

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

Ce logiciel ou matériel a été développé pour un usage général dans le cadre d'applications de gestion des informations. Ce logiciel ou matériel n'est pas conçu ni n'est destiné à être utilisé dans des applications à risque, notamment dans des applications pouvant causer un risque de dommages corporels. Si vous utilisez ce logiciel ou ce matériel dans le cadre d'applications dangereuses, il est de votre responsabilité de prendre toutes les mesures de secours, de sauvegarde, de redondance et autres mesures nécessaires à son utilisation dans des conditions optimales de sécurité. Oracle Corporation et ses affiliés déclinent toute responsabilité quant aux dommages causés par l'utilisation de ce logiciel ou matériel pour des applications dangereuses.

Oracle et Java sont des marques déposées d'Oracle Corporation et/ou de ses affiliés. Tout autre nom mentionné peut correspondre à des marques appartenant à d'autres propriétaires qu'Oracle.

Intel et Intel Xeon sont des marques ou des marques déposées d'Intel Corporation. Toutes les marques SPARC sont utilisées sous licence et sont des marques ou des marques déposées de SPARC International, Inc. AMD, Opteron, le logo AMD et le logo AMD Opteron sont des marques ou des marques déposées d'Advanced Micro Devices. UNIX est une marque déposée de The Open Group.

Ce logiciel ou matériel et la documentation qui l'accompagne peuvent fournir des informations ou des liens donnant accès à des contenus, des produits et des services émanant de tiers. Oracle Corporation et ses affiliés déclinent toute responsabilité ou garantie expresse quant aux contenus, produits ou services émanant de tiers, sauf mention contraire stipulée dans un contrat entre vous et Oracle. En aucun cas, Oracle Corporation et ses affiliés ne sauraient être tenus pour responsables des pertes subies, des coûts occasionnés ou des dommages causés par l'accès à des contenus, produits ou services tiers, ou à leur utilisation, sauf mention contraire stipulée dans un contrat entre vous et Oracle.

#### Accès aux services de support Oracle

Les clients Oracle qui ont souscrit un contrat de support ont accès au support électronique via My Oracle Support. Pour plus d'informations, visitez le site http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info ou le site http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs si vous êtes malentendant.

# **Using This Documentation**

- Overview Provides information that helps experienced assembly language programmers understand disassembled output of Oracle Solaris compilers
  - This manual documents the syntax of the Oracle Solaris x86 assembly language. This manual is neither an introductory book about assembly language programming nor a reference manual for the x86 architecture.
- **Audience** This manual is intended for experienced x86 assembly language programmers who are familiar with the x86 architecture.
- **Required knowledge** You should have a thorough knowledge of assembly language programming in general and be familiar with the x86 architecture in specific. You should be familiar with the ELF object file format.

### **Product Documentation Library**

Documentation and resources for this product and related products are available at http://www.oracle.com/pls/topic/lookup?ctx=E53394-01.

### **Feedback**

Provide feedback about this documentation at http://www.oracle.com/goto/docfeedback.

# · · · CHAPTER 1

### Overview of the Oracle Solaris x86 Assembler

This chapter provides a brief overview of the Oracle Solaris x86 assembler as. This chapter discusses the following topics:

- "1.1 Assembler Overview" on page 15
- "1.2 Syntax Differences Between x86 Assemblers" on page 15

### 1.1 Assembler Overview

The Oracle Solaris x86 assembler as translates Oracle Solaris x86 assembly language into Executable and Linking Format (ELF) relocatable object files that can be linked with other object files to create an executable file or a shared object file. (See Chapter 14, "Object File Format" in *Oracle Solaris 11.3 Linkers and Libraries Guide* for a complete discussion of ELF object file format.) The assembler supports macro processing by the C preprocessor (cpp) or the m4 macro processor.

### 1.2 Syntax Differences Between x86 Assemblers

There is no standard assembly language for the x86 architecture. Vendor implementations of assemblers for the x86 architecture instruction sets differ in syntax and functionality. The syntax of the Oracle Solaris x86 assembler is compatible with the syntax of the assembler distributed with earlier releases of the UNIX operating system (this syntax is sometimes termed "AT&T syntax"). Developers familiar with other assemblers derived from the original UNIX assemblers, such as the Free Software Foundation's gas, will find the syntax of the Oracle Solaris x86 assembler very straightforward.

However, the syntax of x86 assemblers distributed by Intel and Microsoft (sometimes termed "Intel syntax") differs significantly from the syntax of the Oracle Solaris x86 assembler. These differences are most pronounced in the handling of instruction operands:

- The Oracle Solaris and Intel assemblers use the opposite order for source and destination operands.
- The Oracle Solaris assembler specifies the size of memory operands by adding a suffix to the instruction mnemonic, while the Intel assembler prefixes the memory operands.
- The Oracle Solaris assembler prefixes immediate operands with a dollar sign (\$) (ASCII 0x24), while the Intel assembler does not delimit immediate operands.

See Chapter 2, "Oracle Solaris x86 Assembly Language Syntax" for additional differences between x86 assemblers.

# Oracle Solaris x86 Assembly Language Syntax

This chapter documents the syntax of the Oracle Solaris x86 assembly language.

- "2.1 Assembly Language Lexical Conventions" on page 17
- "2.2 Assembly Language Instructions, Operands, and Addressing" on page 21
- "2.3 Assembler Directives" on page 24

### 2.1 Assembly Language Lexical Conventions

This section discusses the lexical conventions of the Oracle Solaris x86 assembly language.

### 2.1.1 Assembly Language Statements

An x86 assembly language program consists of one or more files containing *statements*. A *statement* consists of *tokens* separated by *whitespace* and terminated by either a newline character (ASCII 0x0A) or a semicolon (;) (ASCII 0x3B). *Whitespace* consists of spaces (ASCII 0x20), tabs (ASCII 0x09), and form feeds (ASCII 0x0B) that are not contained in a string or comment. More than one statement can be placed on a single input line provided that each statement is terminated by a semicolon. A statement can consist of a *comment*. *Empty statements*, consisting only of whitespace, are allowed.

### 2.1.1.1 Assembly Language Comments

A *comment* can be appended to a statement. The comment consists of the slash character (/) (ASCII 0x2F) followed by the text of the comment. The comment is terminated by the newline that terminates the statement.

### 2.1.1.2 Assembly Language Labels

A *label* can be placed at the beginning of a statement. During assembly, the label is assigned the current value of the active location counter and serves as an instruction operand. There are two types of labels: *symbolic* and *numeric*.

#### **Assembly Language Symbolic Labels**

A *symbolic* label consists of an *identifier* (or *symbol*) followed by a colon (:) (ASCII 0x3A). Symbolic labels must be defined only once. Symbolic labels have *global* scope and appear in the object file's symbol table.

Symbolic labels with identifiers beginning with a period (.) (ASCII 0x2E) are considered to have *local* scope and are not included in the object file's symbol table.

#### **Assembly Language Numeric Labels**

A *numeric* label consists of a unsigned decimal *int32* value followed by a colon (:). Numeric labels are used only for local reference and are not included in the object file's symbol table. Numeric labels have limited scope and can be redefined repeatedly.

When a numeric label is used as a reference (as an instruction operand, for example), the suffixes b ("backward") or f ("forward") should be added to the numeric label. For numeric label N, the reference Nb refers to the nearest label N defined *before* the reference, and the reference Nf refers to the nearest label N defined *after* the reference. The following example illustrates the use of numeric labels:

```
two:     / define symbolic label "two"

jmp 1b     / jump to last numeric label "1" defined
     / before this instruction
     / (this reference is equivalent to label "two")
```

### 2.1.2 Assembly Language Tokens

There are five classes of tokens:

- Identifiers (symbols)
- Keywords
- Numerical constants
- String Constants
- Operators

### 2.1.2.1 Assembly Language Identifiers

An *identifier* is an arbitrarily-long sequence of letters and digits. The first character must be a letter; the underscore (\_) (ASCII 0x5F) and the period (.) (ASCII 0x2E) are considered to be letters. Case is significant: uppercase and lowercase letters are different.

### 2.1.2.2 Assembly Language Keywords

Keywords such as x86 instruction mnemonics ("opcodes") and assembler directives are reserved for the assembler and should not be used as identifiers. See Chapter 3, "Instruction Set Mapping" for a list of the Oracle Solaris x86 mnemonics. See "2.3 Assembler Directives" on page 24 for the list of as assembler directives.

#### 2.1.2.3 Numerical Constants

Numbers in the x86 architecture can be *integers* or *floating point*. Integers can be *signed* or *unsigned*, with signed integers represented in two's complement representation. Floating-point numbers can be: single-precision floating-point; double-precision floating-point; and double-extended precision floating-point.

#### **Integer Constants**

*Integers* can be expressed in several bases:

- Decimal. Decimal integers begin with a non-zero digit followed by zero or more decimal digits (0-9).
- **Binary.** Binary integers begin with "0b" or "S0B" followed by zero or more binary digits (0, 1).
- **Octal.** Octal integers begin with zero (0) followed by zero or more octal digits (0-7).
- **Hexadecimal.** Hexadecimal integers begin with "0x" or "0X" followed by one or more hexadecimal digits (0-9, A–F). Hexadecimal digits can be either uppercase or lowercase.

#### **Assembly Language Floating Point Constants**

Floating point constants have the following format:

- **Sign** (optional) Either plus (+) or minus (–)
- **Integer** (optional) Zero or more decimal digits (0–9)
- **Fraction** (optional) Decimal point (.) followed by zero or more decimal digits
- **Exponent** (optional) The letter "e" or "E", followed by an optional sign (plus or minus), followed by one or more decimal digits (0-9)

A valid floating point constant must have either an integer part or a fractional part.

### 2.1.2.4 Assembly Language String Constants

A *string* constant consists of a sequence of characters enclosed in double quotes (") (ASCII 0x22). To include a double-quote character ("), single-quote character ('), or backslash character (\) within a string, precede the character with a backslash (\) (ASCII 0x5C). A character can be expressed in a string as its ASCII value in octal preceded by a backslash (for example, the letter "J" could be expressed as "\112"). The assembler accepts the following escape sequences in strings:

| Escape Sequence | Character Name  | ASCII Value (hex) |
|-----------------|-----------------|-------------------|
| \n              | newline         | 0A                |
| \r              | carriage return | 0D                |
| \b              | backspace       | 08                |
| \t              | horizontal tab  | 09                |

| Escape Sequence | Character Name | ASCII Value (hex) |
|-----------------|----------------|-------------------|
| \f              | form feed      | 0C                |
| \v              | vertical tab   | 0B                |

### 2.1.2.5 Assembly Language Operators

The assembler supports the following operators for use in expressions. Operators have no assigned precedence. Expressions can be grouped in square brackets ([]) to establish precedence.

| +         | Addition                |
|-----------|-------------------------|
| -         | Subtraction             |
| <b>\*</b> | Multiplication          |
| \/        | Division                |
| &         | Bitwise logical AND     |
| 1         | Bitwise logical OR      |
| >>        | Shift right             |
| <<        | Shift left              |
| \%        | Remainder               |
| !         | Bitwise logical AND NOT |
| ^         | Bitwise logical XOR     |
|           |                         |

**Note -** The asterisk (\*), slash (/), and percent sign (%) characters are overloaded. When used as operators in an expression, these characters must be preceded by the backslash character (\).

# 2.2 Assembly Language Instructions, Operands, and Addressing

*Instructions* are operations performed by the CPU. *Operands* are entities operated upon by the instruction. *Addresses* are the locations in memory of specified data.

# 2.2.1 Assembly Language Instructions

An *instruction* is a statement that is executed at runtime. An x86 instruction statement can consist of four parts:

- Label (optional)
- Instruction (required)
- Operands (instruction specific)
- Comment (optional)

See "2.1.1 Assembly Language Statements" on page 17 for the description of labels and comments.

The terms *instruction* and *mnemonic* are used interchangeably in this document to refer to the names of x86 instructions. Although the term *opcode* is sometimes used as a synonym for *instruction*, this document reserves the term *opcode* for the hexadecimal representation of the instruction value.

For most instructions, the Oracle Solaris x86 assembler mnemonics are the same as the Intel or AMD mnemonics. However, the Oracle Solaris x86 mnemonics might appear to be different because the Oracle Solaris mnemonics are suffixed with a one-character modifier that specifies the size of the instruction operands. That is, the Oracle Solaris assembler derives its operand type information from the instruction name and the suffix. If a mnemonic is specified with no type suffix, the operand type defaults to long. Possible operand types and their instruction suffixes are:

| b | Byte (8-bit)            |
|---|-------------------------|
| W | Word (16-bit)           |
| ι | Long (32-bit) (default) |
| q | Quadword (64-bit)       |

The assembler recognizes the following suffixes for x87 floating-point instructions:

[no suffix] Instruction operands are registers only

l ("long") Instruction operands are 64-bit

s ("short") Instruction operands are 32-bit

See Chapter 3, "Instruction Set Mapping" for a mapping between Oracle Solaris x86 assembly language mnemonics and the equivalent Intel or AMD mnemonics.

# 2.2.2 Assembly Language Operands

An x86 instruction can have zero to three operands. Operands are separated by commas (,) (ASCII 0x2C). For instructions with two operands, the first (lefthand) operand is the *source* operand, and the second (righthand) operand is the *destination* operand (that is,  $source \rightarrow destination$ ).

**Note -** The Intel assembler uses the opposite order (*destination* ← *source*) for operands.

Operands can be *immediate* (that is, constant expressions that evaluate to an inline value), *register* (a value in the processor number registers), or *memory* (a value stored in memory). An *indirect* operand contains the address of the actual operand value. Indirect operands are specified by prefixing the operand with an asterisk (\*) (ASCII 0x2A). Only jump and call instructions can use indirect operands.

- *Immediate* operands are prefixed with a dollar sign (\$) (ASCII 0x24)
- *Register* names are prefixed with a percent sign (%) (ASCII 0x25)
- Memory operands are specified either by the name of a variable or by a register that contains the address of a variable. A variable name implies the address of a variable and instructs the computer to reference the contents of memory at that address. Memory references have the following syntax:

segment:offset(base, index, scale).

- Segment is any of the x86 architecture segment registers. Segment is optional: if specified, it must be separated from offset by a colon (:). If segment is omitted, the value of %ds (the default segment register) is assumed.
- *Offset* is the displacement from *segment* of the desired memory value. *Offset* is optional.
- Base and index can be any of the general 32-bit number registers.
- Scale is a factor by which index is to be multipled before being added to base to specify
  the address of the operand. Scale can have the value of 1, 2, 4, or 8. If scale is not
  specified, the default value is 1.

Some examples of memory addresses are:

```
movl var, %eax
```

Move the contents of memory location var into number register %eax.

```
movl %cs:var, %eax
```

Move the contents of memory location var in the code segment (register %cs) into number register %eax.

movl \$var, %eax

Move the address of var into number register %eax.

movl array\_base(%esi), %eax

Add the address of memory location array\_base to the contents of number register %esi to determine an address in memory. Move the contents of this address into number register %eax.

```
movl (%ebx, %esi, 4), %eax
```

Multiply the contents of number register <code>%esi</code> by 4 and add the result to the contents of number register <code>%ebx</code> to produce a memory reference. Move the contents of this memory location into number register <code>%eax</code>.

```
movl struct_base(%ebx, %esi, 4), %eax
```

Multiply the contents of number register %esi by 4, add the result to the contents of number register %ebx, and add the result to the address of struct\_base to produce an address. Move the contents of this address into number register %eax.

### 2.3 Assembler Directives

*Directives* are commands that are part of the assembler syntax but are not related to the x86 processor instruction set. All assembler directives begin with a period (.) (ASCII 0x2E).

.align integer, pad

The .align directive causes the next data generated to be aligned modulo *integer* bytes. *Integer* must be a positive integer expression and must be a power of 2. If specified, *pad* is an integer byte value used for padding. The default value of *pad* for the text section is 0x90 (nop); for other sections, the default value of *pad* is zero (0).

.ascii "string"

The .ascii directive places the characters in *string* into the object module at the current location but does *not* terminate the string with a null byte (\0). *String* must be enclosed in double quotes (") (ASCII 0x22). The .ascii directive is not valid for the .bss section.

.bcd integer

The .bcd directive generates a packed decimal (80-bit) value into the current section. The .bcd directive is not valid for the .bss section.

.bss

The .bss directive changes the current section to .bss.

.bss symbol, integer

Define *symbol* in the .bss section and add *integer* bytes to the value of the location counter for .bss. When issued with arguments, the .bss directive does not change the current section to .bss. *Integer* must be positive.

.byte byte1, byte2, ..., byteN

The .byte directive generates initialized bytes into the current section. The .byte directive is not valid for the .bss section. Each *byte* must be an 8-bit value.

.2byte expression1, expression2, ..., expressionN

Refer to the description of the .value directive.

.4byte expression1, expression2, ..., expressionN

Refer to the description of the .long directive.

.8byte expression1, expression2, ..., expressionN

Refer to the description of the .quad directive.

 $.cfi_adjust_cfa_offset\ OFFSET$ 

The .cfi\_adjust\_cfa\_offset directive is similar to .cfi\_def\_cfa\_offset directive but *OFFSET* is a relative value that is added or subtracted from the previous offset.

.cfi\_def\_cfa\_offset OFFSET

The .cfi\_def\_cfa\_offset directive, modifies the rule for computing CFA. The value of the register remains the same, but *OFFSET* is new. Note that this is the absolute offset that will be added to a defined register to compute the CFA address.

 $. \verb|cfi_def_cfa| REGISTER|, OFFSET|$ 

The .cfi\_def\_cfa directive, defines a rule to compute CFA. This directive takes address from *REGISTER* and adds *OFFSET* to it.

 $.cfi_def_cfa_register$  REGISTER

The .cfi\_def\_cfa\_register directive, modifies the rule for computing CFA. The register in the CFA is set to a new value. The offset remains the same.

.cfi\_endproc

The .cfi\_endproc directive, is used at the end of a function where it closes its unwind entry previously opened by .cfi\_startproc and emits it to .eh\_frame.

#### .cfi\_escape EXPRESSION[, ...]

The .cfi\_escape directive, allows you to add arbitrary bytes to the unwind information. You can use this directive to add OS-specific CFI opcodes, or generic CFI opcodes that the assembler does not support.

#### .cfi\_lsda encoding [, exp]

The .cfi\_lsda directive, defines LSDA and its encoding. The *encoding* should be a constant which determines how the LSDA should be encoded. If the value of *encoding* is 255 (DW\_EH\_PE\_omit), second argument is not present, otherwise second argument should be a constant or a symbol name. The default directive used after .cfi\_startproc directive is .cfi lsda 0xff.

#### .cfi\_offset REGISTER, OFFSET

The .cfi\_offset directive, saves the previous value of *REGISTER* at offset *OFFSET* from CFA.

#### .cfi\_personality encoding [, exp]

The .cfi\_personality directive, defines the personality routine and its encoding. The *encoding* must be a constant which determines how the personality should be encoded. If the value of *encoding* is 255 (DW\_EH\_PE\_omit), second argument is not present, otherwise second argument should be a constant or a symbol name. When you are using indirect encodings, the symbol provided should be the location where personality can be loaded from and not the personality routine itself. The default directive used after .cfi startproc directive is .cfi personality 0xff.

#### .cfi register REGISTER1 REGISTER2

The .cfi\_register REGISTER1 REGISTER2 directive, saves the previous value of REGISTER1 in register REGISTER2.

#### $. \verb|cfi_rel_offset| \textit{REGISTER}, OFFSET|$

In the <code>.cfi\_rel\_offset</code> directive, saves the previous value of <code>REGISTER</code> at offset <code>OFFSET</code> from the current CFA register. This is transformed to <code>.cfi\_offset</code> using the known displacement of the CFA register from the CFA. This is often easier to use, because the number will match the code it is annotating.

#### .cfi\_remember\_state

The .cfi\_remember\_state directive, saves all the current rules for all the registers. If the following .cfi\_\* directives is bad, then you can use the .cfi\_restore\_state directive to restore the previous saved state.

#### .cfi\_restore REGISTER

The .cfi\_restore directive, indicates that the rule for register is now the same as it was at the beginning of the function, after all initial instructions added by .cfi\_startproc directive are executed.

#### .cfi restore state

The .cfi restore state directive, restores the previous saved state of the register.

#### .cfi\_return\_column REGISTER

The .cfi\_return\_column directive, changes return column *REGISTER*. The return address is either directly in *REGISTER* or can be accessed by rules for *REGISTER*.

#### .cfi\_same\_value REGISTER

The .cfi\_same\_value directive, indicates the current value of *REGISTER* is the same like in the previous frame and does not require restoration.

#### .cfi\_sections section\_list

The .cfi\_sections section\_list directive, specifies if CFI directives should emit .eh\_frame section and/or .debug\_frame section. You can use .eh\_frame as the section\_list to emit .eh\_frame. You can use the .debug\_frame as the section\_list to emit .debug\_frame. To emit both use .eh\_frame and .debug\_frame as the section\_list. By default, .cfi sections emits .eh frame.

#### $.cfi\_startproc$

The .cfi\_startproc directive, is used at the beginning of each function that should have an entry in .eh\_frame. It initializes some internal data structures and emits architecture dependent initial CFI instructions. Each .cfi\_startproc directive has to be closed by .cfi endproc.

#### .cfi undefined REGISTER

The .cfi\_undefined directive, indicates the point from which the previous value of the register cannot be restored.

#### .comm name, size, alignment

The .comm directive allocates storage in the data section. The storage is referenced by the identifier *name*. *Size* is measured in bytes and must be a positive integer. *Name* cannot be predefined. *Alignment* is optional. If *alignment* is specified, the address of *name* is aligned to a multiple of *alignment*.

#### .data

The .data directive changes the current section to .data.

#### .double float

The .double directive generates a double-precision floating-point constant into the current section. The .double directive is not valid for the .bss section.

.even

The .even directive aligns the current program counter (.) to an even boundary.

.ext expression1, expression2, ..., expressionN

The .ext directive generates an 80387 80-bit floating point constant for each *expression* into the current section. The .ext directive is not valid for the .bss section.

.file "string"

The .file directive creates a symbol table entry where *string* is the symbol name and STT\_FILE is the symbol table type. *String* specifies the name of the source file associated with the object file.

.float float

The .float directive generates a single-precision floating-point constant into the current section. The .float directive is not valid in the .bss section.

.globl symbol1, symbol2, ..., symbolN

The .globl directive declares each *symbol* in the list to be *global*. Each symbol is either defined externally or defined in the input file and accessible in other files. Default bindings for the symbol are overridden. A global symbol definition in one file satisfies an undefined reference to the same global symbol in another file. Multiple definitions of a defined global symbol are not allowed. If a defined global symbol has more than one definition, an error occurs. The .globl directive only declares the symbol to be global in scope, it does not define the symbol.

.group group, section, #comdat

The . group directive adds *section* to a COMDAT *group*. Refer to "COMDAT Section" in *Oracle Solaris 11.3 Linkers and Libraries Guide* for additional information about COMDAT.

.hidden symbol1, symbol2, ..., symbolN

The .hidden directive declares each *symbol* in the list to have *hidden* linker scoping. All references to *symbol* within a dynamic module bind to the definition within that module. *Symbol* is not visible outside of the module.

.ident "string"

The .ident directive creates an entry in the .comment section containing *string*. *String* is any sequence of characters, not including the double quote ("). To include the double quote

character within a string, precede the double quote character with a backslash ( $\setminus$ ) (ASCII 0x5C).

#### .lcomm name, size, alignment

The .lcomm directive allocates storage in the .bss section. The storage is referenced by the symbol *name*, and has a size of *size* bytes. *Name* cannot be predefined, and *size* must be a positive integer. If *alignment* is specified, the address of *name* is aligned to a multiple of *alignment* bytes. If *alignment* is not specified, the default alignment is 4 bytes.

#### .local symbol1, symbol2, ..., symbolN

The .local directive declares each *symbol* in the list to be *local*. Each symbol is defined in the input file and not accessible to other files. Default bindings for the symbols are overridden. Symbols declared with the .local directive take precedence over *weak* and *global* symbols. (See "Symbol Table Section" in *Oracle Solaris 11.3 Linkers and Libraries Guide* for a description of global and weak symbols.) Because local symbols are not accessible to other files, local symbols of the same name may exist in multiple files. The .local directive only declares the symbol to be local in scope, it does not define the symbol.

#### .long expression1, expression2, ..., expressionN

The .long directive generates a long integer (32-bit, two's complement value) for each *expression* into the current section. Each *expression* must be a 32-bit value and must evaluate to an integer value. The .long directive is not valid for the .bss section.

#### $. \, {\tt popsection} \,$

The .popsection directive pops the top of the section stack and continues processing of the popped section.

#### .previous

The .previous directive continues processing of the previous section.

#### $. \, {\tt push section} \, \, section \, \,$

The .pushsection directive pushes the specified section onto the section stack and switches to another section.

#### .quad expression1, expression2, ..., expressionN

The .quad directive generates an initialized word (64-bit, two's complement value) for each *expression* into the current section. Each *expression* must be a 64-bit value, and must evaluate to an integer value. The .quad directive is not valid for the .bss section.

#### . rel symbol@ type

The .rel directive generates the specified relocation entry *type* for the specified *symbol*. The .lit directive supports TLS (thread-local storage). Refer to Chapter 16, "Thread-Local Storage" in *Oracle Solaris 11.3 Linkers and Libraries Guide* for additional information about TLS.

#### .section section, attributes

The .section directive makes *section* the current section. If *section* does not exist, a new section with the specified name and attributes is created. If *section* is a non-reserved section, *attributes* must be included the first time *section* is specified by the .section directive.

#### .set symbol, expression

The .set directive assigns the value of *expression* to *symbol*. *Expression* can be any legal expression that evaluates to a numerical value.

#### .size symbol, expr

Declares the symbol size to be *expr. expr* must be an absolute expression.

#### .skip integer, value

While generating values for any data section, the .skip directive causes *integer* bytes to be skipped over, or, optionally, filled with the specified *value*.

#### .sleb128 expression

The .sleb128 directive generates a signed, little-endian, base 128 number from expression.

#### .string "string"

The .string directive places the characters in *string* into the object module at the current location and terminates the string with a null byte (\0). *String* must be enclosed in double quotes (") (ASCII 0x22). The .string directive is not valid for the .bss section.

#### .symbolic symbol1, symbol2, ..., symbolN

The .symbolic directive declares each *symbol* in the list to have *symbolic* linker scoping. All references to *symbol* within a dynamic module bind to the definition within that module. Outside of the module, *symbol* is treated as global.

#### .tbss

The .tbss directive changes the current section to .tbss. The .tbss section contains uninitialized TLS data objects that will be initialized to zero by the runtime linker.

#### .tcomm

The .tcomm directive defines a TLS common block.

#### .tdata

The .tdata directive changes the current section to .tdata. The .tdata section contains the initialization image for initialized TLS data objects.

#### .text

The .text directive defines the current section as .text.

```
.type symbol[, symbol, ..., symbol], type[, visibility]
```

Declares the type of symbol, where *type* can be:

```
#object #tls_object #function #no_type
and where visibility can be one of:
#hidden #protected #eliminate #singleton #exported #internal
```

#### .uleb128 expression

The .uleb128 directive generates an unsigned, little-endian, base 128 number from *expression*.

```
.value expression1, expression2, ..., expressionN
```

The .value directive generates an initialized word (16-bit, two's complement value) for each *expression* into the current section. Each *expression* must be a 16-bit integer value. The .value directive is not valid for the .bss section.

```
.weak symbol1, symbol2, ..., symbolN
```

The .weak directive declares each *symbol* in the argument list to be defined either externally or in the input file and accessible to other files. Default bindings of the symbol are overridden by the .weak directive. A *weak* symbol definition in one file satisfies an undefined reference to a global symbol of the same name in another file. Unresolved *weak* symbols have a default value of zero. The link editor does not resolve these symbols. If a *weak* symbol has the same name as a defined *global* symbol, the weak symbol is ignored and no error results. The .weak directive does not define the symbol.

#### .zero expression

While filling a data section, the .zero directive fills the number of bytes specified by *expression* with zero (0).

# **Instruction Set Mapping**

This chapter provides a general mapping between the Oracle Solaris x86 assembly language mnemonics and the Intel or Advanced Micro Devices (AMD) mnemonics. Refer to Table 1, "Instruction References," on page 34 for details on individual processor instructions.

- "3.1 Instruction Overview" on page 34
- "3.2 General-Purpose Instructions" on page 35
- "3.3 Floating-Point Instructions" on page 47
- "3.4 SIMD State Management Instructions" on page 52
- Table 21, "ADX Instructions," on page 53
- "3.6 AES Instructions" on page 53
- "3.7 AVX Instructions" on page 54
- "3.8 AVX2 Instructions" on page 77
- "3.9 BMI1 Instructions" on page 85
- "3.10 BMI2 Instructions" on page 85
- "3.11 F16C Instructions" on page 86
- "3.12 FMA Instructions" on page 86
- "3.13 FSGSBASE Instructions" on page 92
- "3.14 MMX Instructions" on page 93

### 3.1 Instruction Overview

It is beyond the scope of this manual to document the x86 architecture instruction set. This chapter provides a general mapping between the Oracle Solaris x86 assembly language mnemonics and the Intel or AMD mnemonics to enable you to refer to the Intel or AMD documentation for detailed information about a specific instruction.

Instructions are listed in tables with the following sections:

- Oracle Solaris mnemonic
- Intel/AMD mnemonic
- Description (short)
- Notes
- Reference

The reference column lists the page number and code for the Intel or AMD manual that documents the instruction. See Table 1, "Instruction References," on page 34 for the codes and links to the associated manuals.

For certain Oracle Solaris mnemonics, the allowed data type suffixes for that mnemonic are indicated in braces ({}) following the mnemonic. For example, bswap{lq} indicates that the following mnemonics are valid: bswap, bswapl (which is the default and equivalent to bswap), and bswapq. See "2.2.1 Assembly Language Instructions" on page 22 for information on data type suffixes.

**TABLE 1** Instruction References

| Manual Code           | Name of the<br>Document | Volume | Link                           |
|-----------------------|-------------------------|--------|--------------------------------|

To locate a specific Oracle Solaris x86 mnemonic, look up the mnemonic in the index.

# 3.2 General-Purpose Instructions

The general-purpose instructions perform basic data movement, memory addressing, arithmetic and logical operations, program flow control, input/output, and string operations on integer, pointer, and BCD data types.

### 3.2.1 Data Transfer Instructions

The data transfer instructions move data between memory and the general-purpose and segment registers, and perform operations such as conditional moves, stack access, and data conversion.

**TABLE 2** Data Transfer Instructions

| Oracle Solaris Mnemonic                 | Intel/AMD Mnemonic | Description                            | Notes                             |
|---|--------------------|--|-----------------------------------|
| bswap{lq}                               | BSWAP              | byte swap                              | bswapq valid only under<br>-m64   |
| cbtw                                    | CBW                | convert byte to word                   |                                   |
| cltd                                    | CDQ                | convert doubleword to quadword         | %eax → %edx:%eax                  |
| cltq                                    | CDQE               | convert doubleword to quadword         | %eax → %rax                       |
|   |                    |  | cltq valid only under -m64        |
| <pre>cmova{wlq}, cmov {wlq}.a</pre>     | CMOVA              | conditional move if above              | cmovaq valid only under<br>-m64   |
| <pre>cmovae{wlq}, cmov {wlq}.ae</pre>   | CMOVAE             | conditional move if above or equal     | cmovaeq valid only under<br>-m64  |
| <pre>cmovb{wlq}, cmov {wlq}.b</pre>     | CMOVB              | conditional move if below              | cmovbq valid only under<br>-m64   |
| <pre>cmovbe{wlq}, cmov {wlq}.be</pre>   | CMOVBE             | conditional move if below or equal     | cmovbeq valid only under<br>-m64  |
| <pre>cmovc{wlq}, cmov {wlq}.c</pre>     | CMOVC              | conditional move if carry              | cmovcq valid only under<br>-m64   |
| <pre>cmove{wlq}, cmov {wlq}.e</pre>     | CMOVE              | conditional move if equal              | cmoveq valid only under<br>-m64   |
| <pre>cmovg{wlq}, cmov {wlq}.g</pre>     | CMOVG              | conditional move if greater            | cmovgq valid only under<br>-m64   |
| <pre>cmovge{wlq}, cmov {wlq}.ge</pre>   | CMOVGE             | conditional move if greater or equal   | cmovgeq valid only under<br>-m64  |
| <pre>cmovl{wlq}, cmov {wlq}.l</pre>     | CMOVL              | conditional move if less               | cmovlq valid only under<br>-m64   |
| <pre>cmovle{wlq}, cmov {wlq}.le</pre>   | COMVLE             | conditional move if less or equal      | cmovleq valid only under<br>-m64  |
| <pre>cmovna{wlq}, cmov {wlq}.na</pre>   | CMOVNA             | conditional move if not above          | cmovnaq valid only under<br>-m64  |
| <pre>cmovnae{wlq}, cmov {wlq}.nae</pre> | CMOVNAE            | conditional move if not above or equal | cmovnaeq valid only under<br>-m64 |
| <pre>cmovnb{wlq}, cmov {wlq}.nb</pre>   | CMOVNB             | conditional move if not below          | cmovnbq valid only under<br>-m64  |

| Oracle Solaris Mnemonic                 | Intel/AMD Mnemonic | Description                                 | Notes                             |
|---|--------------------|---|-----------------------------------|
| <pre>cmovnbe{wlq}, cmov {wlq}.nbe</pre> | CMOVNBE            | conditional move if not below or equal      | cmovnbeq valid only under<br>-m64 |
| <pre>cmovnc{wlq}, cmov {wlq}.nc</pre>   | CMOVNC             | conditional move if not carry               | cmovncq valid only under<br>-m64  |
| <pre>cmovne{wlq}, cmov {wlq}.ne</pre>   | CMOVNE             | conditional move if not equal               | cmovneq valid only under<br>-m64  |
| <pre>cmovng{wlq}, cmov {wlq}.ng</pre>   | CMOVNG             | conditional move if greater                 | cmovngq valid only under<br>-m64  |
| <pre>cmovnge{wlq}, cmov {wlq}.nge</pre> | CMOVNGE            | conditional move if not greater or equal    | cmovngeq valid only under<br>-m64 |
| <pre>cmovnl{wlq}, cmov {wlq}.nl</pre>   | CMOVNL             | conditional move if not less                | cmovnlq valid only under<br>-m64  |
| <pre>cmovnle{wlq}, cmov {wlq}.nle</pre> | CMOVNLE            | conditional move if not above or equal      | cmovnleq valid only under<br>-m64 |
| <pre>cmovno{wlq}, cmov {wlq}.no</pre>   | CMOVNO             | conditional move if not overflow            | cmovnoq valid only under<br>-m64  |
| <pre>cmovnp{wlq}, cmov {wlq}.np</pre>   | CMOVNP             | conditional move if not parity              | cmovnpq valid only under<br>-m64  |
| <pre>cmovns{wlq}, cmov {wlq}.ns</pre>   | CMOVNS             | conditional move if not sign (non-negative) | cmovnsq valid only under<br>-m64  |
| <pre>cmovnz{wlq}, cmov {wlq}.nz</pre>   | CMOVNZ             | conditional move if not zero                | cmovnzq valid only under<br>-m64  |
| <pre>cmovo{wlq}, cmov {wlq}.o</pre>     | CMOVO              | conditional move if overflow                | cmovoq valid only under<br>-m64   |
| <pre>cmovp{wlq}, cmov {wlq}.p</pre>     | CMOVP              | conditional move if parity                  | cmovpq valid only under<br>-m64   |
| <pre>cmovpe{wlq}, cmov{wlq}. pe</pre>   | CMOVPE             | conditional move if parity even             | cmovpeq valid only under<br>-m64  |
| <pre>cmovpo{wlq}, cmov{wlq}. po</pre>   | CMOVPO             | conditional move if parity odd              | cmovpoq valid only under<br>-m64  |
| <pre>cmovs{wlq}, cmov{wlq}.s</pre>      | CMOVS              | conditional move if sign (negative)         | cmovsq valid only under<br>-m64   |
| <pre>cmovz{wlq}, cmov{wlq}.z</pre>      | CMOVZ              | conditional move if zero                    | cmovzq valid only under<br>-m64   |
| cmpxchg{bwlq}                           | CMPXCHG            | compare and exchange                        | cmpxchgq valid only under<br>-m64 |
| cmpxchg8b                               | CMPXCHG8B          | compare and exchange 8 bytes                |                                   |
| cqtd                                    | CQO                | convert quadword to octword                 | %rax → %rdx:%rax                  |
|   |                    |   | cqtd valid only under -m64        |

| pushaw                           | PUSHA              | push general-purpose<br>registers onto stack  | pushaw invalid under -m64                   |
| pushal, pusha                    | PUSHAD             | push general-purpose<br>registers onto stack  | invalid under -m64                          |
| xadd{bwlq}                       | XADD               | exchange and add  | xaddq valid only under<br>-m64              |
| xchg{bwlq}                       | XCHG               | exchange  | xchgq valid only under<br>-m64              |
| xchg{bwlq}A                      | XCHG               | exchange  | xchgqA valid only under<br>-m64             |

## 3.2.2 Binary Arithmetic Instructions

The binary arithmetic instructions perform basic integer computions on operands in memory or the general-purpose registers.

**TABLE 3** Binary Arithmetic Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description          | Notes                          |
|-------------------------|--------------------|----------------------|--------------------------------|
| adc{bwlq}               | ADC                | add with carry       | adcq valid only under -m64     |
| add{bwlq}               | ADD                | integer add          | addq valid only under -m64     |
| cmp{bwlq}               | CMP                | compare              | cmpq valid only under -m64     |
| dec{bwlq}               | DEC                | decrement            | decq valid only under -m64     |
| div{bwlq}               | DIV                | divide (unsigned)    | divq valid only under -m64     |
| idiv{bwlq}              | IDIV               | divide (signed)      | idivq valid only under<br>-m64 |
| imul{bwlq}              | IMUL               | multiply (signed)    | imulq valid only under<br>-m64 |
| inc{bwlq}               | INC                | increment            | incq valid only under -m64     |
| mul{bwlq}               | MUL                | multiply (unsigned)  | mulq valid only under -m64     |
| neg{bwlq}               | NEG                | negate               | negq valid only under -m64     |
| sbb{bwlq}               | SBB                | subtract with borrow | sbbq valid only under -m64     |
| sub{bwlq}               | SUB                | subtract             | subq valid only under -m64     |

#### 3.2.3 Decimal Arithmetic Instructions

The decimal arithmetic instructions perform decimal arithmetic on binary coded decimal (BCD) data.

**TABLE 4** Decimal Arithmetic Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                       | Notes              |
|-------------------------|--------------------|-----------------------------------|--------------------|
| aaa                     | AAA                | ASCII adjust after addition       | invalid under -m64 |
| aad                     | AAD                | ASCII adjust before division      | invalid under -m64 |
| aam                     | AAM                | ASCII adjust after multiplication | invalid under -m64 |
| aas                     | AAS                | ASCII adjust after subtraction    | invalid under -m64 |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                      | Notes              |
|-------------------------|--------------------|----------------------------------|--------------------|
| daa                     | DAA                | decimal adjust after addition    | invalid under -m64 |
| das                     | DAS                | decimal adjust after subtraction | invalid under -m64 |

# 3.2.4 Logical Instructions

The logical instructions perform basic logical operations on their operands.

**TABLE 5** Logical Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                     | Notes                      |
|-------------------------|--------------------|---------------------------------|----------------------------|
| and{bwlq}               | AND                | bitwise logical AND             | andq valid only under -m64 |
| not{bwlq}               | NOT                | bitwise logical NOT             | notq valid only under -m64 |
| or{bwlq}                | OR                 | bitwise logical OR              | orq valid only under -m64  |
| xor{bwlq}               | XOR                | bitwise logical exclusive<br>OR | xorq valid only under -m64 |

#### 3.2.5 Shift and Rotate Instructions

The shift and rotate instructions shift and rotate the bits in their operands.

**TABLE 6** Shift and Rotate Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                | Notes                          |
|-------------------------|--------------------|----------------------------|--------------------------------|
| rcl{bwlq}               | RCL                | rotate through carry left  | rclq valid only under -m64     |

# 3.2.6 Bit and Byte Instructions

The bit instructions test and modify individual bits in operands. The byte instructions set the value of a byte operand to indicate the status of flags in the <code>%eflags</code> register.

**TABLE 7** Bit and Byte Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                      | Notes                      |
|-------------------------|--------------------|----------------------------------|----------------------------|

| loopne                  | LOOPNE             | loop with %ecx and not equal        |                                 |
| loopnz                  | LOOPNZ             | loop with %ecx and not zero         |                                 |
| loopz                   | L00PZ              | loop with %ecx and zero             |                                 |
| lret                    | RET                | return from far procedure           | valid as indirect only for m64  |
| ret                     | RET                | return                              |                                 |

#### 3.2.8 String Instructions

The string instructions operate on strings of bytes. Operations include storing strings in memory, loading strings from memory, comparing strings, and scanning strings for substrings.

**Note -** The Oracle Solaris mnemonics for certain instructions differ slightly from the Intel/AMD mnemonics. Alphabetization of the table below is by the Oracle Solaris mnemonic. All string operations default to long (doubleword).

**TABLE 9** String Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                | Notes  |
|-------------------------|--------------------|----------------------------|--|
| cmps{q}                 | CMPS               | compare string             | cmpsq valid only under<br>-m64   |
| cmpsb                   | CMPSB              | compare byte string        |  |
| cmpsl                   | CMPSD              | compare doubleword string  |  |
| cmpsw                   | CMPSW              | compare word string        |  |
| lods{q}                 | LODS               | load string                | lodsq valid only under<br>-m64   |
| lodsb                   | LODSB              | load byte string           |  |
| lodsl                   | LODSD              | load doubleword string     |  |
| lodsw                   | LODSW              | load word string           |  |
| movs{q}                 | MOVS               | move string                | movsq valid only under<br>-m64   |
| movsb                   | MOVSB              | move byte string           | movsb is not movsb<br>{wlq}. See Table 2, "Data<br>Transfer Instructions," on<br>page 36 |
| movsl, smovl            | MOVSD              | move doubleword string     |  |
| movsw, smovw            | MOVSW              | move word string           | movsw is not movsw<br>{lq}. See Table 2, "Data<br>Transfer Instructions," on<br>page 36  |
| rep                     | REP                | repeat while %ecx not zero |  |
| repnz                   | REPNE              | repeat while not equal     |  |
| repnz                   | REPNZ              | repeat while not zero      |  |
| repz                    | REPE               | repeat while equal         |  |
| repz                    | REPZ               | repeat while zero          |  |
| scas{q}                 | SCAS               | scan string                | scasq valid only under<br>-m64   |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description             | Notes                          |
|-------------------------|--------------------|-------------------------|--------------------------------|
| scasb                   | SCASB              | scan byte string        |                                |
| scasl                   | SCASD              | scan doubleword string  |                                |
| scasw                   | SCASW              | scan word string        |                                |
| stos{q}                 | STOS               | store string            | stosq valid only under<br>-m64 |
| stosb                   | STOSB              | store byte string       |                                |
| stosl                   | STOSD              | store doubleword string |                                |
| stosw                   | STOSW              | store word string       |                                |

#### 3.2.9 I/O Instructions

The input/output instructions transfer data between the processor's I/O ports, registers, and memory.

**TABLE 10** I/O Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                       | Notes |
|-------------------------|--------------------|-----------------------------------|-------|
| in                      | IN                 | read from a port                  |       |
| ins                     | INS                | input string from a port          |       |
| insb                    | INSB               | input byte string from port       |       |
| insl                    | INSD               | input doubleword string from port |       |
| insw                    | INSW               | input word string from port       |       |
| out                     | OUT                | write to a port                   |       |
| outs                    | OUTS               | output string to port             |       |
| outsb                   | OUTSB              | output byte string to port        |       |
| outsl                   | OUTSD              | output doubleword string to port  |       |
| outsw                   | OUTSW              | output word string to port        |       |

## 3.2.10 Flag Control (EFLAG) Instructions

The status flag control instructions operate on the bits in the %eflags register.

**TABLE 11** Flag Control Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                   | Notes                           |
|-------------------------|--------------------|-------------------------------|---------------------------------|
| clc                     | CLC                | clear carry flag              |                                 |
| cld                     | CLD                | clear direction flag          |                                 |
| cli                     | CLI                | clear interrupt flag          |                                 |
| cmc                     | CMC                | complement carry flag         |                                 |
| lahf                    | LAHF               | load flags into %ah register  |                                 |
| popfw                   | POPF               | pop %eflags from stack        |                                 |
| popf{lq}                | POPFL              | pop %eflags from stack        | popfq valid only under<br>-m64  |
| pushfw                  | PUSHF              | push %eflags onto stack       |                                 |
| pushf{lq}               | PUSHFL             | push %eflags onto stack       | pushfq valid only under<br>-m64 |
| sahf                    | SAHF               | store %ah register into flags |                                 |
| stc                     | STC                | set carry flag                |                                 |
| std                     | STD                | set direction flag            |                                 |
| sti                     | STI                | set interrupt flag            |                                 |

## **3.2.11** Segment Register Instructions

The segment register instructions load far pointers (segment addresses) into the segment registers.

**TABLE 12** Segment Register Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                | Notes                               |
|-------------------------|--------------------|----------------------------|-------------------------------------|
| lds{wl}                 | LDS                | load far pointer using %ds | ldsl and ldsw invalid<br>under -m64 |
| les{wl}                 | LES                | load far pointer using %es | lesl and lesw invalid<br>under -m64 |
| lfs{wl}                 | LFS                | load far pointer using %fs |                                     |
| lgs{wl}                 | LGS                | load far pointer using %gs |                                     |
| lss{wl}                 | LSS                | load far pointer using %ss |                                     |

#### 3.2.12 Miscellaneous Instructions

The instructions documented in this section provide a number of useful functions.

**TABLE 13** Miscellaneous Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description              | Notes                      |
|-------------------------|--------------------|--------------------------|----------------------------|
| cpuid                   | CPUID              | processor identification |                            |
| lea{wlq}                | LEA                | load effective address   | leaq valid only under -m64 |
| nop                     | NOP                | no operation             |                            |
| ud2                     | UD2                | undefined instruction    |                            |
| xlat                    | XLAT               | table lookup translation |                            |
| xlatb                   | XLATB              | table lookup translation |                            |

## 3.3 Floating-Point Instructions

The floating point instructions operate on floating-point, integer, and binary coded decimal (BCD) operands.

## 3.3.1 Data Transfer Instructions (Floating Point)

The data transfer instructions move floating-point, integer, and BCD values between memory and the floating point registers.

**TABLE 14** Data Transfer Instructions (Floating-Point)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| fbld                    | FBLD               | load BCD  |       |
| fbstp                   | FBSTP              | store BCD and pop                                     |       |
| fcmovb                  | FCMOVB             | floating-point conditional move if below              |       |
| fcmovbe                 | FCMOVBE            | floating-point conditional move if below or equal     |       |
| fcmove                  | FCMOVE             | floating-point conditional move if equal              |       |
| fcmovnb                 | FCMOVNB            | floating-point conditional move if not below          |       |
| fcmovnbe                | FCMOVNBE           | floating-point conditional move if not below or equal |       |
| fcmovne                 | FCMOVNE            | floating-point conditional move if not equal          |       |
| fcmovnu                 | FCMOVNU            | floating-point conditional move if unordered          |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                                  | Notes |
|-------------------------|--------------------|--|-------|
| fcmovu                  | FCMOVU             | floating-point conditional move if unordered |       |
| fild                    | FILD               | load integer                                 |       |
| fist                    | FIST               | store integer                                |       |
| fistp                   | FISTP              | store integer and pop                        |       |
| fld                     | FLD                | load floating-point value                    |       |
| fst                     | FST                | store floating-point value                   |       |
| fstp                    | FSTP               | store floating-point value and pop           |       |
| fxch                    | FXCH               | exchange registers                           |       |

# 3.3.2 Basic Arithmetic Instructions (Floating-Point)

The basic arithmetic instructions perform basic arithmetic operations on floating-point and integer operands.

**TABLE 15** Basic Arithmetic Instructions (Floating-Point)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                           | Notes |
|-------------------------|--------------------|---------------------------------------|-------|
| fabs                    | FABS               | absolute value                        |       |
| fadd                    | FADD               | add floating-point                    |       |
| faddp                   | FADDP              | add floating-point and pop            |       |
| fchs                    | FCHS               | change sign                           |       |
| fdiv                    | FDIV               | divide floating-point                 |       |
| fdivp                   | FDIVP              | divide floating-point and pop         |       |
| fdivr                   | FDIVR              | divide floating-point reverse         |       |
| fdivrp                  | FDIVRP             | divide floating-point reverse and pop |       |
| fiadd                   | FIADD              | add integer                           |       |
| fidiv                   | FIDIV              | divide integer                        |       |
| fidivr                  | FIDIVR             | divide integer reverse                |       |
| fimul                   | FIMUL              | multiply integer                      |       |
| fisub                   | FISUB              | subtract integer                      |       |
| fisubr                  | FISUBR             | subtract integer reverse              |       |
| fmul                    | FMUL               | multiply floating-point               |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                             | Notes |
|-------------------------|--------------------|---|-------|
| fmulp                   | FMULP              | multiply floating-point and pop         |       |
| fprem                   | FPREM              | partial remainder                       |       |
| fprem1                  | FPREM1             | IEEE partial remainder                  |       |
| frndint                 | FRNDINT            | round to integer                        |       |
| fscale                  | FSCALE             | scale by power of two                   |       |

# 3.3.3 Comparison Instructions (Floating-Point)

The floating-point comparison instructions operate on floating-point or integer operands.

**TABLE 16** Comparison Instructions (Floating-Point)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                                     | Notes |
|-------------------------|--------------------|---|-------|
| fcom                    | FCOM               | compare floating-point                          |       |
| fcomi                   | FCOMI              | compare floating-point and set %eflags          |       |
| fcomip                  | FCOMIP             | compare floating-point, set<br>%eflags, and pop |       |
| fcomp                   | FCOMP              | compare floating-point and pop                  |       |
| fcompp                  | FCOMPP             | compare floating-point and pop twice            |       |
| ficom                   | FICOM              | compare integer                                 |       |
| ficomp                  | FICOMP             | compare integer and pop                         |       |
| ftst                    | FTST               | test floating-point (compare with 0.0)          |       |
| fucom                   | FUCOM              | unordered compare<br>floating-point             |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| fucomi                  | FUCOMI             | unordered compare<br>floating-point and set<br>%eflags       |       |
| fucomip                 | FUCOMIP            | unordered compare<br>floating-point, set %eflags,<br>and pop |       |
| fucomp                  | FUCOMP             | unordered compare<br>floating-point and pop                  |       |
| fucompp                 | FUCOMPP            | compare floating-point and pop twice                         |       |
| fxam                    | FXAM               | examine floating-point                                       |       |

#### 3.3.4 Transcendental Instructions (Floating-Point)

The transcendental instructions perform trigonometric and logarithmic operations on floating-point operands.

**TABLE 17** Transcendental Instructions (Floating-Point)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                         | Notes |
|-------------------------|--------------------|-------------------------------------|-------|
| f2xm1                   | F2XM1              | computes 2 <sup>x</sup> -1          |       |
| fcos                    | FCOS               | cosine                              |       |
| fpatan                  | FPATAN             | partial arctangent                  |       |
| fptan                   | FPTAN              | partial tangent                     |       |
| fsin                    | FSIN               | sine                                |       |
| fsincos                 | FSINCOS            | sine and cosine                     |       |
| fyl2x                   | FYL2X              | computes y * log <sub>2</sub> x     |       |
| fyl2xp1                 | FYL2XP1            | computes y * log <sub>2</sub> (x+1) |       |

### 3.3.5 Load Constants (Floating-Point) Instructions

The load constants instructions load common constants, such as  $\pi$ , into the floating-point registers.

**TABLE 18** Load Constants Instructions (Floating-Point)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description | Notes |
|-------------------------|--------------------|-------------|-------|
| fld1                    | FLD1               | load +1.0   |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description              | Notes |
|-------------------------|--------------------|--------------------------|-------|
| fldl2e                  | FLDL2E             | load log <sub>2</sub> e  |       |
| fldl2t                  | FLDL2T             | load log <sub>2</sub> 10 |       |
| fldlg2                  | FLDLG2             | load log <sub>10</sub> 2 |       |
| fldln2                  | FLDLN2             | load log <sub>e</sub> 2  |       |
| fldpi                   | FLDPI              | load π                   |       |
| fldz                    | FLDZ               | load +0.0                |       |

## 3.3.6 Control Instructions (Floating-Point)

The floating-point control instructions operate on the floating-point register stack and save and restore the floating-point state.

**TABLE 19** Control Instructions (Floating-Point)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| fclex                   | FCLEX              | clear floating-point<br>exception flags after<br>checking for error<br>conditions   |       |
| fdecstp                 | FDECSTP            | decrement floating-point register stack pointer                                     |       |
| ffree                   | FFREE              | free floating-point register  |       |
| fincstp                 | FINCSTP            | increment floating-point register stack pointer                                     |       |
| finit                   | FINIT              | initialize floating-point<br>unit after checking error<br>conditions                |       |
| fldcw                   | FLDCW              | load floating-point unit control word   |       |
| fldenv                  | FLDENV             | load floating-point unit environment  |       |
| fnclex                  | FNCLEX             | clear floating-point<br>exception flags without<br>checking for error<br>conditions |       |
| fninit                  | FNINIT             | initialize floating-point<br>unit without checking error<br>conditions              |       |
| fnop                    | FNOP               | floating-point no operation   |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| fnsave                  | FNSAVE             | save floating-point unit<br>state without checking<br>error conditions         |       |
| fnstcw                  | FNSTCW             | store floating-point unit<br>control word without<br>checking error conditions |       |
| fnstenv                 | FNSTENV            | store floating-point unit<br>environment without<br>checking error conditions  |       |
| fnstsw                  | FNSTSW             | store floating-point unit<br>status word without<br>checking error conditions  |       |
| frstor                  | FRSTOR             | restore floating-point unit state  |       |
| fsave                   | FSAVE              | save floating-point unit<br>state after checking error<br>conditions           |       |
| fstcw                   | FSTCW              | store floating-point<br>unit control word after<br>checking error conditions   |       |
| fstenv                  | FSTENV             | store floating-point<br>unit environment after<br>checking error conditions    |       |
| fstsw                   | FSTSW              | store floating-point unit<br>status word after checking<br>error conditions    |       |
| fwait                   | FWAIT              | wait for floating-point unit   |       |
| wait                    | WAIT               | wait for floating-point unit   |       |

# 3.4 SIMD State Management Instructions

The fxsave and fxrstor instructions save and restore the state of the floating-point unit and the MMX, XMM, and MXCSR registers.

**TABLE 20** SIMD State Management Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                                | Notes |
|-------------------------|--------------------|--|-------|
| fxrstor                 | FXRST0R            | restore floating-point unit and SIMD state |       |
| fxsave                  | FXSAVE             | save floating-point unit and SIMD state    |       |

#### 3.5 ADX Instructions

**TABLE 21** ADX Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Reference                                |
|-------------------------|--------------------|--|--|
| adcx                    | ADCX               | Unsigned Integer Addition<br>of Two Operands With<br>Carry Flag    | page 93-94 (325383-<br>053US/Jan.2015)   |
| adox                    | ADOX               | Unsigned Integer Addition<br>of Two Operands With<br>Overflow Flag | page 108-109 (325383-<br>053US/Jan.2015) |

|                         | WRGSBASE           | DdSe                     | 04003/3ер.2013)                        |

#### 3.14 MMX Instructions

The MMX instructions enable x86 processors to perform single-instruction, multiple-data (SIMD) operations on packed byte, word, doubleword, or quadword integer operands contained in memory, in MMX registers, or in general-purpose registers.

### 3.14.1 Data Transfer Instructions (MMX)

The data transfer instructions move doubleword and quadword operands between MMX registers and between MMX registers and memory.

**TABLE 31** Data Transfer Instructions (MMX)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description     | Notes                          |
|-------------------------|--------------------|-----------------|--------------------------------|
| movd                    | MOVD               | move doubleword | movdq valid only under<br>-m64 |
| movq                    | MOVQ               | move quadword   | valid only under -m64          |

## 3.14.2 Conversion Instructions (MMX)

The conversion instructions pack and unpack bytes, words, and doublewords.

**TABLE 32** Conversion Instructions (MMX)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| packssdw                | PACKSSDW           | pack doublewords into<br>words with signed<br>saturation |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                                    | Notes |
|-------------------------|--------------------|--|-------|
| packsswb                | PACKSSWB           | pack words into bytes with signed saturation   |       |
| packuswb                | PACKUSWB           | pack words into bytes with unsigned saturation |       |
| punpckhbw               | PUNPCKHBW          | unpack high-order bytes                        |       |
| punpckhdq               | PUNPCKHDQ          | unpack high-order<br>doublewords               |       |
| punpckhwd               | PUNPCKHWD          | unpack high-order words                        |       |
| punpcklbw               | PUNPCKLBW          | unpack low-order bytes                         |       |
| punpckldq               | PUNPCKLDQ          | unpack low-order<br>doublewords                |       |
| punpcklwd               | PUNPCKLWD          | unpack low-order words                         |       |

# 3.14.3 Packed Arithmetic Instructions (MMX)

The packed arithmetic instructions perform packed integer arithmetic on packed byte, word, and doubleword integers.

**TABLE 33** Packed Arithmetic Instructions (MMX)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| paddb                   | PADDB              | add packed byte integers                                   |       |
| paddd                   | PADDD              | add packed doubleword integers                             |       |
| paddsb                  | PADDSB             | add packed signed byte integers with signed saturation     |       |
| paddsw                  | PADDSW             | add packed signed word integers with signed saturation     |       |
| paddusb                 | PADDUSB            | add packed unsigned byte integers with unsigned saturation |       |
| paddusw                 | PADDUSW            | add packed unsigned word integers with unsigned saturation |       |
| paddw                   | PADDW              | add packed word integers                                   |       |
| pmaddwd                 | PMADDWD            | multiply and add packed<br>word integers                   |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| pmulhw                  | PMULHW             | multiply packed signed<br>word integers and store<br>high result      |       |
| pmullw                  | PMULLW             | multiply packed signed<br>word integers and store<br>low result       |       |
| psubb                   | PSUBB              | subtract packed byte integers   |       |
| psubd                   | PSUBD              | subtract packed<br>doubleword integers                                |       |
| psubsb                  | PSUBSB             | subtract packed signed<br>byte integers with signed<br>saturation     |       |
| psubsw                  | PSUBSW             | subtract packed signed<br>word integers with signed<br>saturation     |       |
| psubusb                 | PSUBUSB            | subtract packed unsigned<br>byte integers with<br>unsigned saturation |       |
| psubusw                 | PSUBUSW            | subtract packed unsigned<br>word integers with<br>unsigned saturation |       |
| psubw                   | PSUBW              | subtract packed word integers   |       |

# 3.14.4 Comparison Instructions (MMX)

The compare instructions compare packed bytes, words, or doublewords.

**TABLE 34** Comparison Instructions (MMX)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| pcmpeqb                 | PCMPEQB            | compare packed bytes for equal                             |       |
| pcmpeqd                 | PCMPEQD            | compare packed<br>doublewords for equal                    |       |
| pcmpeqw                 | PCMPEQW            | compare packed words for equal                             |       |
| pcmpgtb                 | PCMPGTB            | compare packed signed<br>byte integers for greater<br>than |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| pcmpgtd                 | PCMPGTD            | compare packed signed<br>doubleword integers for<br>greater than |       |
| pcmpgtw                 | PCMPGTW            | compare packed signed<br>word integers for greater<br>than       |       |

## 3.14.5 Logical Instructions (MMX)

The logical instructions perform logical operations on quadword operands.

**TABLE 35** Logical Instructions (MMX)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description             | Notes |
|-------------------------|--------------------|-------------------------|-------|
| pand                    | PAND               | bitwise logical AND     |       |
| pandn                   | PANDN              | bitwise logical AND NOT |       |
| por                     | POR                | bitwise logical OR      |       |
| pxor                    | PXOR               | bitwise logical XOR     |       |

# 3.14.6 Shift and Rotate Instructions (MMX)

The shift and rotate instructions operate on packed bytes, words, doublewords, or quadwords in 64-bit operands.

**TABLE 36** Shift and Rotate Instructions (MMX)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                               | Notes |
|-------------------------|--------------------|---|-------|
| pslld                   | PSLLD              | shift packed doublewords<br>left logical  |       |
| psllq                   | PSLLQ              | shift packed quadword left logical        |       |
| psllw                   | PSLLW              | shift packed words left logical           |       |
| psrad                   | PSRAD              | shift packed doublewords right arithmetic |       |
| psraw                   | PSRAW              | shift packed words right arithmetic       |       |
| psrld                   | PSRLD              | shift packed doublewords right logical    |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                         | Notes |
|-------------------------|--------------------|-------------------------------------|-------|
| psrlq                   | PSRLQ              | shift packed quadword right logical |       |
| psrlw                   | PSRLW              | shift packed words right logical    |       |

# 3.14.7 State Management Instructions (MMX)

The emms (EMMS) instruction clears the MMX state from the MMX registers.

**TABLE 37** State Management Instructions (MMX)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description     | Notes |
|-------------------------|--------------------|-----------------|-------|
| emms                    | EMMS               | empty MMX state |       |

#### 3.15 MOVBE Instructions

**TABLE 38** MOVBE Instructions

## 3.20 SSE Instructions

SSE instructions are an extension of the SIMD execution model introduced with the MMX technology. SSE instructions are divided into four subgroups:

- SIMD single-precision floating-point instructions that operate on the XMM registers
- MXSCR state management instructions
- 64-bit SIMD integer instructions that operate on the MMX registers
- Instructions that provide cache control, prefetch, and instruction ordering functionality

# 3.20.1 SIMD Single-Precision Floating-Point Instructions (SSE)

The SSE SIMD instructions operate on packed and scalar single-precision floating-point values located in the XMM registers or memory.

#### 3.20.1.1 Data Transfer Instructions (SSE)

The SSE data transfer instructions move packed and scalar single-precision floating-point operands between XMM registers and between XMM registers and memory.

**TABLE 43** Data Transfer Instructions (SSE)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| movaps                  | MOVAPS             | move four aligned packed<br>single-precision floating-<br>point values between<br>XMM registers or memory  |       |
| movhlps                 | MOVHLPS            | move two packed single-<br>precision floating-<br>point values from the<br>high quadword of an<br>XMM register to the low<br>quadword of another<br>XMM register |       |
| movhps                  | MOVHPS             | move two packed single-<br>precision floating-point<br>values to or from the high<br>quadword of an XMM<br>register or memory                                    |       |
| movlhps                 | MOVLHPS            | move two packed single-<br>precision floating-point<br>values from the low<br>quadword of an XMM<br>register to the high<br>quadword of another<br>XMM register  |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| movlps                  | MOVLPS             | move two packed single-<br>precision floating-point<br>values to or from the low<br>quadword of an XMM<br>register or memory |       |
| movmskps                | MOVMSKPS           | extract sign mask from<br>four packed single-<br>precision floating-point<br>values  |       |
| movss                   | MOVSS              | move scalar single-<br>precision floating-point<br>value between XMM<br>registers or memory                                  |       |
| movups                  | MOVUPS             | move four unaligned<br>packed single-precision<br>floating-point values<br>between XMM registers or<br>memory                |       |

#### 3.20.1.2 Packed Arithmetic Instructions (SSE)

SSE packed arithmetic instructions perform packed and scalar arithmetic operations on packed and scalar single-precision floating-point operands.

**TABLE 44** Packed Arithmetic Instructions (SSE)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| addps                   | ADDPS              | add packed single-<br>precision floating-point<br>values            |       |
| addss                   | ADDSS              | add scalar single-precision floating-point values                   |       |
| divps                   | DIVPS              | divide packed single-<br>precision floating-point<br>values         |       |
| divss                   | DIVSS              | divide scalar single-<br>precision floating-point<br>values         |       |
| maxps                   | MAXPS              | return maximum packed<br>single-precision floating-<br>point values |       |
| maxss                   | MAXSS              | return maximum scalar<br>single-precision floating-<br>point values |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| minps                   | MINPS              | return minimum packed<br>single-precision floating-<br>point values                            |       |
| minss                   | MINSS              | return minimum scalar single-precision floating-point values.                                  |       |
| mulps                   | MULPS              | multiply packed single-<br>precision floating-point<br>values                                  |       |
| mulss                   | MULSS              | multiply scalar single-<br>precision floating-point<br>values                                  |       |
| rcpps                   | RCPPS              | compute reciprocals of packed single-precision floating-point values                           |       |
| rcpss                   | RCPSS              | compute reciprocal of<br>scalar single-precision<br>floating-point values                      |       |
| rsqrtps                 | RSQRTPS            | compute reciprocals of<br>square roots of packed<br>single-precision floating-<br>point values |       |
| rsqrtss                 | RSQRTSS            | compute reciprocal of<br>square root of scalar<br>single-precision floating-<br>point values   |       |
| sqrtps                  | SQRTPS             | compute square roots of packed single-precision floating-point values                          |       |
| sqrtss                  | SQRTSS             | compute square root of<br>scalar single-precision<br>floating-point values                     |       |
| subps                   | SUBPS              | subtract packed single-<br>precision floating-point<br>values                                  |       |
| subss                   | SUBSS              | subtract scalar single-<br>precision floating-point<br>values                                  |       |

## 3.20.1.3 Comparison Instructions (SSE)

The SEE compare instructions compare packed and scalar single-precision floating-point operands.

**TABLE 45** Comparison Instructions (SSE)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| cmpps                   | CMPPS              | compare packed single-<br>precision floating-point<br>values  |       |
| cmpss                   | CMPSS              | compare scalar single-<br>precision floating-point<br>values  |       |
| comiss                  | COMISS             | perform ordered<br>comparison of scalar<br>single-precision floating-<br>point values and set flags<br>in EFLAGS register   |       |
| ucomiss                 | UCOMISS            | perform unordered<br>comparison of scalar<br>single-precision floating-<br>point values and set flags<br>in EFLAGS register |       |

#### 3.20.1.4 Logical Instructions (SSE)

The SSE logical instructions perform bitwise AND, AND NOT, OR, and XOR operations on packed single-precision floating-point operands.

**TABLE 46** Logical Instructions (SSE)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| andnps                  | ANDNPS             | perform bitwise logical<br>AND NOT of packed<br>single-precision floating-<br>point values |       |
| andps                   | ANDPS              | perform bitwise logical<br>AND of packed single-<br>precision floating-point<br>values     |       |
| orps                    | ORPS               | perform bitwise logical OR<br>of packed single-precision<br>floating-point values          |       |
| xorps                   | XORPS              | perform bitwise logical<br>XOR of packed single-<br>precision floating-point<br>values     |       |

#### 3.20.1.5 Shuffle and Unpack Instructions (SSE)

The SSE shuffle and unpack instructions shuffle or interleave single-precision floating-point values in packed single-precision floating-point operands.

**TABLE 47** Shuffle and Unpack Instructions (SSE)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| shufps                  | SHUFPS             | shuffles values in packed<br>single-precision floating-<br>point operands                                    |       |
| unpckhps                | UNPCKHPS           | unpacks and interleaves<br>the two high-order values<br>from two single-precision<br>floating-point operands |       |
| unpcklps                | UNPCKLPS           | unpacks and interleaves<br>the two low-order values<br>from two single-precision<br>floating-point operands  |       |

#### 3.20.1.6 Conversion Instructions (SSE)

The SSE conversion instructions convert packed and individual doubleword integers into packed and scalar single-precision floating-point values.

**TABLE 48** Conversion Instructions (SSE)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| cvtpi2ps                | CVTPI2PS           | convert packed<br>doubleword integers to<br>packed single-precision<br>floating-point values   |       |
| cvtps2pi                | CVTPS2PI           | convert packed single-<br>precision floating-<br>point values to packed<br>doubleword integers |       |
| cvtsi2ss                | CVTSI2SS           | convert doubleword<br>integer to scalar single-<br>precision floating-point<br>value           |       |
| cvtss2si                | CVTSS2SI           | convert scalar single-<br>precision floating-point<br>value to a doubleword<br>integer         |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| cvttps2pi               | CVTTPS2PI          | convert with truncation<br>packed single-precision<br>floating-point values<br>to packed doubleword<br>integers |       |
| cvttss2si               | CVTTSS2SI          | convert with truncation<br>scalar single-precision<br>floating-point value to<br>scalar doubleword integer      |       |

# 3.20.2 MXCSR State Management Instructions (SSE)

The MXCSR state management instructions save and restore the state of the MXCSR control and status register.

**TABLE 49** MXCSR State Management Instructions (SSE)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                | Notes |
|-------------------------|--------------------|----------------------------|-------|
| ldmxcsr                 | LDMXCSR            | load %mxcsr register       |       |
| stmxcsr                 | STMXCSR            | save %mxcsr register state |       |

# 3.20.3 64-Bit SIMD Integer Instructions (SSE)

The SSE 64-bit SIMD integer instructions perform operations on packed bytes, words, or doublewords in MMX registers.

**TABLE 50** 64-Bit SIMD Integer Instructions (SSE)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description                                      | Notes |
|-------------------------|--------------------|--|-------|
| pavgb                   | PAVGB              | compute average of packed unsigned byte integers |       |
| pavgw                   | PAVGW              | compute average of packed unsigned byte integers |       |
| pextrw                  | PEXTRW             | extract word                                     |       |
| pinsrw                  | PINSRW             | insert word                                      |       |
| pmaxsw                  | PMAXSW             | maximum of packed signed word integers           |       |
| pmaxub                  | PMAXUB             | maximum of packed unsigned byte integers         |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| pminsw                  | PMINSW             | minimum of packed signed word integers                  |       |
| pminub                  | PMINUB             | minimum of packed unsigned byte integers                |       |
| pmovmskb                | PMOVMSKB           | move byte mask  |       |
| pmulhuw                 | PMULHUW            | multiply packed unsigned integers and store high result |       |
| psadbw                  | PSADBW             | compute sum of absolute differences                     |       |
| pshufw                  | PSHUFW             | shuffle packed integer<br>word in MMX register          |       |

# 3.20.4 Miscellaneous Instructions (SSE)

The following instructions control caching, prefetching, and instruction ordering.

**TABLE 51** Miscellaneous Instructions (SSE)

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| maskmovq                | MASKMOVQ           | non-temporal store of<br>selected bytes from<br>an MMX register into<br>memory  |       |
| movntps                 | MOVNTPS            | non-temporal store of four<br>packed single-precision<br>floating-point values from<br>an XMM register into<br>memory |       |
| movntq                  | MOVNTQ             | non-temporal store of<br>quadword from an MMX<br>register into memory   |       |
| prefetchnta             | PREFETCHNTA        | prefetch data into non-<br>temporal cache structure<br>and into a location close to<br>the processor                  |       |
| prefetcht0              | PREFETCHT0         | prefetch data into all levels of the cache hierarchy  |       |
| prefetcht1              | PREFETCHT1         | prefetch data into level 2 cache and higher   |       |
| prefetcht2              | PREFETCHT2         | prefetch data into level 2 cache and higher   |       |
| sfence                  | SFENCE             | serialize store operations  |       |

#### 3.21 SSE2 Instructions

SSE2 instructions are an extension of the SIMD execution model introduced with the MMX technology and the SSE extensions. SSE2 instructions are divided into four subgroups:

- Packed and scalar double-precision floating-point instructions
- Packed single-precision floating-point conversion instructions
- 128-bit SIMD integer instructions
- Instructions that provide cache control and instruction ordering functionality

# 3.21.1 SSE2 Packed and Scalar Double-Precision Floating-Point Instructions

The SSE2 packed and scalar double-precision floating-point instructions operate on double-precision floating-point operands.

#### 3.21.1.1 SSE2 Data Movement Instructions

The SSE2 data movement instructions move double-precision floating-point data between XMM registers and memory.

**TABLE 52** SSE2 Data Movement Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| movapd                  | MOVAPD             | move two aligned packed<br>double-precision floating-<br>point values between<br>XMM registers and<br>memory                   |       |
| movhpd                  | MOVHPD             | move high packed double-<br>precision floating-point<br>value to or from the high<br>quadword of an XMM<br>register and memory |       |
| movlpd                  | MOVLPD             | move low packed single-<br>precision floating-point<br>value to or from the low<br>quadword of an XMM<br>register and memory   |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| movmskpd                | MOVMSKPD           | extract sign mask from two<br>packed double-precision<br>floating-point values                                |       |
| movsd                   | MOVSD              | move scalar double-<br>precision floating-point<br>value between XMM<br>registers and memory.                 |       |
| movupd                  | MOVUPD             | move two unaligned<br>packed double-precision<br>floating-point values<br>between XMM registers<br>and memory |       |

#### 3.21.1.2 SSE2 Packed Arithmetic Instructions

The SSE2 arithmetic instructions operate on packed and scalar double-precision floating-point operands.

**TABLE 53** SSE2 Packed Arithmetic Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| addpd                   | ADDPD              | add packed double-<br>precision floating-point<br>values            |       |
| addsd                   | ADDSD              | add scalar double-<br>precision floating-point<br>values            |       |
| divpd                   | DIVPD              | divide packed double-<br>precision floating-point<br>values         |       |
| divsd                   | DIVSD              | divide scalar double-<br>precision floating-point<br>values         |       |
| maxpd                   | MAXPD              | return maximum packed<br>double-precision floating-<br>point values |       |
| maxsd                   | MAXSD              | return maximum scalar<br>double-precision floating-<br>point value  |       |
| minpd                   | MINPD              | return minimum packed<br>double-precision floating-<br>point values |       |
| minsd                   | MINSD              | return minimum scalar<br>double-precision floating-<br>point value  |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| mulpd                   | MULPD              | multiply packed double-<br>precision floating-point<br>values                          |       |
| mulsd                   | MULSD              | multiply scalar double-<br>precision floating-point<br>values                          |       |
| sqrtpd                  | SQRTPD             | compute packed square<br>roots of packed double-<br>precision floating-point<br>values |       |
| sqrtsd                  | SQRTSD             | compute scalar square root<br>of scalar double-precision<br>floating-point value       |       |
| subpd                   | SUBPD              | subtract packed double-<br>precision floating-point<br>values                          |       |
| subsd                   | SUBSD              | subtract scalar double-<br>precision floating-point<br>values                          |       |

#### 3.21.1.3 SSE2 Logical Instructions

The SSE2 logical instructions operate on packed double-precision floating-point values.

**TABLE 54** SSE2 Logical Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| andnpd                  | ANDNPD             | perform bitwise logical<br>AND NOT of packed<br>double-precision floating-<br>point values |       |
| andpd                   | ANDPD              | perform bitwise logical<br>AND of packed double-<br>precision floating-point<br>values     |       |
| orpd                    | ORPD               | perform bitwise logical OR<br>of packed double-precision<br>floating-point values          |       |
| xorpd                   | XORPD              | perform bitwise logical<br>XOR of packed double-<br>precision floating-point<br>values     |       |

#### 3.21.1.4 SSE2 Compare Instructions

The SSE2 compare instructions compare packed and scalar double-precision floating-point values and return the results of the comparison to either the destination operand or to the EFLAGS register.

**TABLE 55** SSE2 Compare Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| cmppd                   | CMPPD              | compare packed double-<br>precision floating-point<br>values  |       |
| cmpsd                   | CMPSD              | compare scalar double-<br>precision floating-point<br>values  |       |
| comisd                  | COMISD             | perform ordered<br>comparison of scalar<br>double-precision floating-<br>point values and set flags<br>in EFLAGS register   |       |
| ucomisd                 | UCOMISD            | perform unordered<br>comparison of scalar<br>double-precision floating-<br>point values and set flags<br>in EFLAGS register |       |

#### 3.21.1.5 SSE2 Shuffle and Unpack Instructions

The SSE2 shuffle and unpack instructions operate on packed double-precision floating-point operands.

**TABLE 56** SSE2 Shuffle and Unpack Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| shufpd                  | SHUFPD             | shuffle values in packed<br>double-precision floating-<br>point operands                                |       |
| unpckhpd                | UNPCKHPD           | unpack and interleave<br>the high values from two<br>packed double-precision<br>floating-point operands |       |
| unpcklpd                | UNPCKLPD           | unpack and interleave<br>the low values from two<br>packed double-precision<br>floating-point operands  |       |

#### 3.21.1.6 SSE2 Conversion Instructions

The SSE2 conversion instructions convert packed and individual doubleword integers into packed and scalar double-precision floating-point values (and vice versa). These instructions also convert between packed and scalar single-precision and double-precision floating-point values.

**TABLE 57** SSE2 Conversion Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
| cvtdq2pd                | CVTDQ2PD           | convert packed<br>doubleword integers to<br>packed double-precision<br>floating-point values                         |       |
| cvtpd2dq                | CVTPD2DQ           | convert packed double-<br>precision floating-<br>point values to packed<br>doubleword integers                       |       |
| cvtpd2pi                | CVTPD2PI           | convert packed double-<br>precision floating-<br>point values to packed<br>doubleword integers                       |       |
| cvtpd2ps                | CVTPD2PS           | convert packed double-<br>precision floating-point<br>values to packed single-<br>precision floating-point<br>values |       |
| cvtpi2pd                | CVTPI2PD           | convert packed<br>doubleword integers to<br>packed double-precision<br>floating-point values                         |       |
| cvtps2pd                | CVTPS2PD           | convert packed single-<br>precision floating-point<br>values to packed double-<br>precision floating-point<br>values |       |
| cvtsd2si                | CVTSD2SI           | convert scalar double-<br>precision floating-point<br>values to a doubleword<br>integer                              |       |
| cvtsd2ss                | CVTSD2SS           | convert scalar double-<br>precision floating-point<br>values to scalar single-<br>precision floating-point<br>values |       |
| cvtsi2sd                | CVTSI2SD           | convert doubleword integer to scalar double-   |       |

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description  | Notes |
|-------------------------|--------------------|--|-------|
|                         |                    | precision floating-point value   |       |
| cvtss2sd                | CVTSS2SD           | convert scalar single-<br>precision floating-point<br>values to scalar double-<br>precision floating-point<br>values |       |
| cvttpd2dq               | CVTTPD2DQ          | convert with truncation<br>packed double-precision<br>floating-point values<br>to packed doubleword<br>integers      |       |
| cvttpd2pi               | CVTTPD2PI          | convert with truncation<br>packed double-precision<br>floating-point values<br>to packed doubleword<br>integers      |       |
| cvttsd2si               | CVTTSD2SI          | convert with truncation<br>scalar double-precision<br>floating-point values to<br>scalar doubleword integers         |       |

# 3.21.2 SSE2 Packed Single-Precision Floating-Point Instructions

The SSE2 packed single-precision floating-point instructions operate on single-precision floating-point and integer operands.

 TABLE 58
 SSE2 Packed Single-Precision Floating-Point Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| cvtdq2ps                | CVTDQ2PS           | convert packed<br>doubleword integers to<br>packed single-precision<br>floating-point values                    |       |
| cvtps2dq                | CVTPS2DQ           | convert packed single-<br>precision floating-<br>point values to packed<br>doubleword integers                  |       |
| cvttps2dq               | CVTTPS2DQ          | convert with truncation<br>packed single-precision<br>floating-point values<br>to packed doubleword<br>integers |       |

# 3.21.3 SSE2 128-Bit SIMD Integer Instructions

The SSE2 SIMD integer instructions operate on packed words, doublewords, and quadwords contained in XMM and MMX registers.

**TABLE 59** SSE2 128-Bit SIMD Integer Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes |
|-------------------------|--------------------|---|-------|
| movdq2q                 | MOVDQ2Q            | move quadword integer<br>from XMM to MMX<br>registers |       |
| movdqa                  | MOVDQA             | move aligned double quadword                          |       |
| movdqu                  | MOVDQU             | move unaligned double quadword                        |       |
| movq2dq                 | MOVQ2DQ            | move quadword integer<br>from MMX to XMM<br>registers |       |
| paddq                   | PADDQ              | add packed quadword integers                          |       |
| pmuludq                 | PMULUDQ            | multiply packed unsigned doubleword integers          |       |
| pshufd                  | PSHUFD             | shuffle packed<br>doublewords                         |       |
| pshufhw                 | PSHUFHW            | shuffle packed high words                             |       |
| pshuflw                 | PSHUFLW            | shuffle packed low words                              |       |
| pslldq                  | PSLLDQ             | shift double quadword left logical                    |       |
| psrldq                  | PSRLDQ             | shift double quadword right logical                   |       |
| psubq                   | PSUBQ              | subtract packed quadword integers                     |       |
| punpckhqdq              | PUNPCKHQDQ         | unpack high quadwords                                 |       |
| punpcklqdq              | PUNPCKLQDQ         | unpack low quadwords                                  |       |

#### 3.21.4 SSE2 Miscellaneous Instructions

The SSE2 instructions described below provide additional functionality for caching non-temporal data when storing data from XMM registers to memory, and provide additional control of instruction ordering on store operations.

**TABLE 60** SSE2 Miscellaneous Instructions

| Oracle Solaris Mnemonic | Intel/AMD Mnemonic | Description   | Notes                            |
|-------------------------|--------------------|---|----------------------------------|
| clflush                 | CLFLUSH            | flushes and invalidates a<br>memory operand and its<br>associated cache line from<br>all levels of the processor's<br>cache hierarchy |                                  |
| lfence                  | LFENCE             | serializes load operations  |                                  |
| maskmovdqu              | MASKMOVDQU         | non-temporal store of<br>selected bytes from<br>an XMM register into<br>memory  |                                  |
| mfence                  | MFENCE             | serializes load and store operations  |                                  |
| movntdq                 | MOVNTDQ            | non-temporal store of<br>double quadword from<br>an XMM register into<br>memory   |                                  |
| movnti                  | MOVNTI             | non-temporal store of<br>a doubleword from a<br>general-purpose register<br>into memory   | movntiq valid only under<br>-m64 |
| movntpd                 | MOVNTPD            | non-temporal store of two<br>packed double-precision<br>floating-point values from<br>an XMM register into<br>memory                  |                                  |
| pause                   | PAUSE              | improves the performance of spin-wait loops   |                                  |

#### **64-Bit AMD Opteron Considerations** 3.32

To assemble code for the AMD Opteron CPU, invoke the assembler with the -m64 command line option. See the as(1) man page for additional information.

The following Oracle Solaris mnemonics are only valid when the -m64 command line option is specified:

adcq cmovnoq addq andq bsfq bsrq bswapq btcq btq btrq btsq cltq cmpq cmovaeq cmovaq cmovbeq cqtd cmovbq cqto cmovcq decq divq cmoveq idivq cmovgeq cmovgq imulq cmovleq incq cmovlq larq cmovnaeq leaq cmovnaq lodsq cmovnbeg lslq cmovnbq cmovncq cmovneq cmovngeq movq cmovngq cmovnleq cmovnlq

cmovnpq cmovnsq cmovnzq cmovoq cmovpeq cmovpoq cmovpq cmovsq cmovzq cmpsq cmpxchgq movabs movdq movntiq movsq movswq movzwq

mulq negq notq orq popfq popq pushfq pushq rclq rcrq rolq rorq salq sarq sbbq scasq shldq shlq shrdq shrq sldtq smswq stosq strq subq testq xaddq xchgq xchgqA xorq

The following Oracle Solaris mnemonics are *not* valid when the -m64 command line option is specified:

| aaa    | daa   | lesw   |
|--------|-------|--------|
| aad    | das   | popa   |
| aam    | into  | popaw  |
| aas    | jecxz | pusha  |
| boundw | ldsw  | pushaw |

### + + + APPENDIX A

### Using the Assembler Command Line

This appendix describes how to invoke the assembler from the command line, and details the command-line options.

#### A.1 Assembler Command Line

You invoke the assembler command line as follows:

as [options] [inputfile] ...

**Note -** The Oracle Solaris Studio C, C++, and Fortran compilers (cc(1), CC(1), and f95(1)) invoke the assembler with the fbe command. You can use either the as or fbe command on a Oracle Solaris platform to invoke the assembler. On an Oracle Solaris x86 platform, the as or fbe command will invoke the x86 assembler. On an Oracle Solaris SPARC platform, the command invokes the SPARC assembler.

The as command translates the assembly language source files, <code>inputfile</code>, into an executable object file, <code>objfile</code>. The assembler recognizes the filename argument <code>hyphen</code> (-) as the standard input. It accepts more than one file name on the command line. The input file is the concatenation of all the specified files. If an invalid option is given or the command line contains a syntax error, the assembler prints the error (including a synopsis of the command line syntax and options) to standard error output, and then terminates.

The assembler supports macros, #include files, and symbolic substitution through use of the C preprocessor cpp(1). The assembler invokes the preprocessor before assembly begins if it has been specified from the command line as an option. (See the -P option.)

#### A.2 Assembler Command Line Options

-a32

Allow 32-bit addresses in 64-bit mode.

-Dname -Dname=def

When the -P option is in effect, these options are passed to the cpp preprocessor without interpretation by the as command; otherwise, they are ignored.

-{n}H

Enable (-H) or suppress (-nH) generation of the Hardware Capabilities section.

- Ipath

When the -P option is in effect, this option is passed to the cpp preprocessor without interpretation by the as command; otherwise, it is ignored.

- i

Ignore line number information from the preprocessor.

-KPIC

Check for address referencing with absolute relocation and issue warning.

- m

This option runs m4 macro preprocessing on input. The m4 preprocessor is more useful for complex preprocessing than the C preprocessor invoked by the -P option. See the m4(1) man page for more information about the m4 macro-processor.

-m64|-m32

Select the 64-bit (-m64) or 32-bit (-m32) memory model. With -m64, the resulting .o object files are in 64-bit ELF format and can only be linked with other object files in the same

format. The resulting executable can only be run on a 64-bit x86 processor running 64-bit Oracle Solaris OS. -m32 is the default.

- n

Suppress all warnings while assembling.

-o outfile

Write the output of the assembler to *outfile*. By default, if -o is not specified, the output file name is the same as the input file name with .s replaced with .o.

- P

Run cpp(1), the C preprocessor, on the files being assembled. The preprocessor is run separately on each input file, not on their concatenation. The preprocessor output is passed to the assembler.

 $-Q{y|n}$ 

This option produces the "assembler version" information in the comment section of the output object file if the y option is specified; if the n option is specified, the information is suppressed.

#### -S[a|b|c|l|A|B|C|L]

Produces a disassembly of the emitted code to the standard output. Adding each of the following characters to the -S option produces:

- a disassembling with address
- b disassembling with ".bof"
- c disassembling with comments
- 1 disassembling with line numbers

Capital letters turn the switch off for the corresponding option.

**-** S

This option places all stabs in the ".stabs" section. By default, stabs are placed in "stabs.excl" sections, which are stripped out by the static linker ld during final execution. When

the -s option is used, stabs remain in the final executable because ".stab" sections are not stripped out by the static linker ld.

#### - Uname

When the -P option is in effect, this option is passed to the cpp preprocessor without interpretation by the as command; otherwise, it is ignored.

-V

This option writes the version information on the standard error output.

#### -xchip=processor

*processor* specifies the target architecture processor. When there is a choice between several possible encodings, choose the one that is appropriate for the stated chip. In particular, use the appropriate no-op byte sequence to fill code alignment padding, and warn when instructions not defined for the stated chip are used.

The assembler accepts the instruction sets for the following recognized -xchip processor values:

| processor value | Target Processor   |
|-----------------|--------------------|
| generic         | Generic x86        |
| native          | Host processor.    |
| core2           | Intel Core2        |
| nehalem         | Intel Nehalem      |
| opteron         | AMD Opteron        |
| penryn          | Intel Penryn       |
| pentium         | Intel Pentium      |
| pentium_pro     | Intel Pentium Pro  |
| pentium3        | Intel Pentium 3.   |
| pentium4        | Intel Pentium 4    |
| sandybridge     | Intel Sandy Bridge |
| westmere        | Intel Westmere     |
| amdfam10        | AMD FAM10          |
| ivybridge       | Intel Ivy Bridge   |
| haswell         | Intel Hawell       |
| broadwell       | Intel Broadwell    |

```
-xmodel=[small | medium | kernel]
```

For -m64 only, generate R\_X86\_64\_32S relocatable type for data access under kernel. Otherwise, generate R\_X86\_64\_32 under small. SHN\_AMD64\_LCOMMON and .lbcomm support added under medium. The default is small.

 $-Y\{d|m\}$ , path

Specify the path to locate the version of cm4defs (-Yd, path) or m4 (-Ym, path) to use.

-YI, path

Indicate path to search for #include header files.

### A.3 Disassembling Object Code

The dis program is the object code disassembler for ELF. It produces an assembly language listing of the object file. For detailed information about this function, see the dis(1) man page.
